Auto Trading System Project Summary

This document summarizes the full process of building an automated trading system using TradingView, Python, and MetaTrader 5.

1. TradingView Setup:

- Created alerts using UT Bot.

- Alerts send signals (BUY/SELL) via email.

2. Python Script:

- Connects to Gmail using IMAP.

- Reads latest emails.

- Extracts BUY or SELL signals.

- Writes signal to Signal.txt file inside MT5 directory.

3. File Handling Fixes:

- Fixed encoding issues by using ASCII/plain text.

- Ensured correct file path inside MT5 (MQL5/Files).

4. MT5 Expert Advisor (EA):

- Reads Signal.txt.

- Detects BUY or SELL.

- Closes existing trades.

- Opens new trades accordingly.

5. Major Problems Solved:

- Email not updating → fixed by scanning latest messages.

- File empty → fixed file path and writing method.

- Encoding errors → switched to ASCII.

- MT5 not reading → used binary read method.

- Trade errors (10016) → removed SL/TP temporarily.

6. Final Result:

- System successfully opens trades automatically based on TradingView alerts.

Next Steps (Optional Future Improvements):

- Add Stop Loss and Take Profit.

- Prevent duplicate trades.

- Add risk management.

- Improve execution speed.
